- Table B: Industrial production indices
- Table C: Construction and public works statistics

INTRODUCTION

1. The 1983 World Programme of Industrial Statistics, the third programme of the kind organized under the auspices of the Statistical Commission of the United Nations, is a general framework which countries can use to establish national industrial statistics systems to cope with the growing need for data felt by politicians, economists and development aid agencies.

2. Like the 1963 and 1973 programmes, the 1983 World Programme of Industrial Statistics has the following general objectives:

- (i) To encourage countries to carry out orderly inquiries into the structure and activity of the industrial sector;
- (ii) To guide and co-ordinate action undertaken by the various countries in terms of industrial censuses with the view to improving the scope and comparability of available data at the international level;
- (iii) Lastly, to facilitate the exchange of information on the structure and activity of the industrial sector.

3. After a brief introduction to the 1983 World Programme of Industrial Statistics, the present document will take stock of the situation in the region and endeavour to highlight the priority elements of the Programme for African countries and the resources required to promote its implementation at the national level.

1. General characteristics and content of the 1983 World Programme of Industrial Statistics

4. The 1983 World Programme of Industrial Statistics covers the entire industrial sector as defined in international recommendations, i.e. all establishments within territorial boundaries engaged primarily in mining, manufacturing and the production and distribution of electricity, gas and water (major divisions 2, 3 and 4 of the International Standard Industrial Classification of All Economic Activities). Household units should be considered part of the industrial sector and studied under the programme if the share of their production of goods and services for sale or trade represents an important proportion of total industrial activity.

5. The central element of the 1983 World Programme of Industrial Statistics is a series of guide-lines concerning the organization and conduct of an industrial census at the national level. It is suggested that the census should be undertaken in 1983 or thereabouts. The magnitude of the resources to be used for such an operation will depend on the level of development of national, industrial statistics. Countries which are beginning to set-up a system of industrial statistics will have to innovate while other countries will simply modify the existing inquiry system or supplement the machinery which has already been set-up to produce annual industrial statistics.

6. Under the recommendations for the Programme, the establishment should be the statistical unit for industrial inquiries which should aim at collecting data on all establishments or in other words yielding satisfactory estimates for the entire industrial sector. To that end, Programme recommends that there should be a complete enumeration of industrial establishments employing at least five persons and sampling to collect information on smaller establishments. Where there is a complete repertory of small establishments, stratification methods based on the size of the establishment will provide data on such establishments. If there is none, area sampling is recommended.

7. The basic concepts are, on the whole, the same as those proposed for the previous programme. However, the 1983 World Programme of Industrial Statistics pays greater attention to the problem of coverage of small units and contains specific recommendations for the collection of data on family industries which play an appreciable role in so many developing economies. Moreover, the guidelines concerning the design and presentation of survey forms are illustrated in the 1983 Programme by two model questionnaires (complete and summary) which countries in the region may make use of to good effect.
8. Concerning the categories of data to be collected and the priority to be accorded to each heading, there are three options: a minimum programme for countries which are just establishing an industrial statistics system, and intermediate programme for countries whose industrial statistics system is not yet very sophisticated and a detailed programme for advanced countries.
9. The minimum programme contains a very limited number of items, namely the identification of the establishment and its main activity, paid employees, wages and salaries paid and receipts. The scope of inquiries carried out in the context of the minimum programme should be as broad as possible. A complete enumeration of establishments under the programme will help to build up an industrial register which, with regular updating, will become a valuable tool for the future development of national industrial statistics.
10. The other two programmes have the same items but they differ from each other in that the priority assigned to the various items varies at times depending on whether or not the country has a sophisticated system of industrial statistics. Hence the priority attached to an item depends on the one hand on the relative importance of that item on the other hand on the cost and difficulty of collecting the relevant information. The countries for which these two programmes were designed should collect a sizeable range of information in particular on employment and earnings, stocks, fixed capital formation, input costs and value added.
11. The data collected under the programme should be tabulated according to industrial activity and geographic area. They may be aggregated moreover according to size of establishment, legal status and type of ownership. So as to ensure the comparability of the results of inquiries carried out under the programme, it is recommended that the 1968 version of ISIC should be used for the classification of standard items down to the four-digit level of classification.
12. The partial list of products and materials which constituted part two of the 1973 World Programme may also be considered an integral part of the 1983 Programme. The list has been designed not only to help countries to prepare national production and consumption statistics for specific products but also to facilitate international comparability of such statistics and at the same time to provide a corps of data to be used in analyzing interindustrial trade flows in each country and establishing regional and world production and consumption aggregates.

13. This list cannot take place of a global classification of products and materials. Countries which want to establish such a classification at the national level for the purpose of the census provided for in the 1983 World Programme of Industrial Statistics could make use of the draft International Standard Classification of All Goods and Services (E/CN.3/493).

14. With regard to data processing, the recommendations of the 1973 World Programme have been revised to take into account the fact that electronic data processing is now the prevailing system in almost all developing countries for processing inquiry statistics. Moreover, given the importance of final checking of results prior to publication, a special chapter has been devoted to that matter in the 1983 Programme.

15. Moreover, the preparation of statistical processing plans has been reviewed in depth and specific guidelines have been issued concerning the presentation and different cross-classifications of results. In that regard, the 1983 World Programme of Industrial Statistics recommends, in particular, that the following summary tables should be prepared.

(i) Minimum programme

Table 1: Principal indicators of industrial activity classified by industry

Industry (four-digit ISIC)	Number of establish- ments	Number of persons engaged	Employees		Total receipts in producers' prices
			Number	Wages and salaries	

(ii) Detailed programme

Table 1(a): Principal indicators of industrial activity, classified industry

Industry (four- digit ISIC)	Number of establish- ments	Number of persons engaged	Employees		Value of output services	Cost of materials and industrial services	Value added	Changes in stocks	Gross addi- tions to fixed assets
			Number	Wages and salaries					

Item	1	2	2(b)	3	13	8	a/	6.2-n.1	7
------	---	---	------	---	----	---	----	---------	---

(a) Census value added calculated as follows: item 13 less item 8.

- Table 1(b). Principal indicators of industrial activity, classified by geographical area and industry (two-digit and three-digit ISIC).
- Table 1(c). Principal indicators of industrial activity, classified by industry (two-digit ISIC) the establishment size class.
- Table 1(d). Principal indicators of industrial activity, classified by industry (two-digit ISIC) and type of establishment.

Proposed time-table for the initiation  
of an integrated industrial statistics system, 1983-1993

Year	Type of inquiry		Quarterly (or monthly)
	Census	Annual	
1983	A	X	X
1984 <u>a/</u>	X	X	X
1985	X	B	B
1986	X	B	B
1987	X	C	B
1988 <u>b/</u>	X	C	C
1989 to 1992	X	D	C
1993	A	<u>c/</u>	C

a/ No inquiry is proposed for 1984, which would be devoted to preparatory operations.

b/ Countries may choose to conduct a bench-mark census for 1988.

c/ In the census year the annual survey is integrated into the bench mark inquiry.

A - All establishments.

B - Cut-off sample of large establishments only.

C - Probability sample (large sample) - yielding industry group data for the country as a whole and total manufacturing (or mining and quarrying) for most of the principal geographical areas.

D - Probability sample (larger than C) - yielding industry group data for all of the principal geographical areas.

17. Industrial censuses, which are crucial to integrated national industrial statistics, should be supplemented by annual sample surveys aimed at collecting the principal indicators of industrial activity and by more frequent inquiries on a quarterly or monthly basis for those critical measures subject to seasonal or short-term changes, such as production and manpower. For countries initially developing a system of economic statistics, a full coverage enumeration of industrial establishments confined to the collection of basic data should still be a first priority. Such an enumeration should be followed as closely as possible by an annual sample inquiry into industrial activity.

2. Assessment of the situation in the region and priority elements of the 1983 World Programme of Industrial Statistics for African countries

2.1. Assessment of the situation in the African region

18. Although considerable progress has been made in the last 10 years, industrial statistics still suffer from a number of deficiencies which derive both from the organization of national statistical systems and from the inadequacy of available resources.

19. As their coverage is generally limited, African industrial statistics also have sizeable gaps from the qualitative point of view. In fact, since the scope of the inquiries is often woolly, satisfactory estimates cannot be obtained for the entire industrial sector. Moreover, the reliability of the information collected is in many cases undermined by the survey techniques used and the reluctance of industrial establishments to provide exact statements for fear that they might be systematically exploited by the authorities for purposes of taxation.

20. The volume of information available has increased considerably since the first World Programme of Industrial Statistics was launched by the United Nations in 1963. However, important indicators such as industrial production by-product, capital formation by type of capital goods, work days, materials consumed by nature and origin and changes in stocks by main components are not collected by a large number of countries in the region. Moreover only a third of the countries prepare industrial production indices.

21. Often the methodology used to organize and conduct industrial inquiries is unsuitable in many ways. The content of many national survey forms, their presentation, wording and sequence of items should be improved. There is also cause for concern about the definition of the scope of inquiries, the choice of collection techniques and statistical units and the choice of data processing and analysis methods. Moreover, only a limited number of countries in the region systematically exploit the data collected, publish the results of their industrial inquiries promptly and ensure their wide dissemination.

22. Moreover, few countries in the region have a complete industrial register which is kept up-to-date regularly. Most African statistical services have partial lists of industrial units and use Chamber of Commerce year books and tax and social security files. The coverage of those sources is often incomplete, marred by errors and ill-suited to the objectives of industrial inquiries.

23. On the whole, very little progress has been made with regard to the collection of data on small industrial units. Only a few very partial inquiries have been carried out on artisan-type units so far using very diverse methods which need considerable substantive improvements. Such inquiries are often connected with the implementation of sectoral economic development projects.

24. Lastly, although over the last 20 years most countries in the region have set up a programme of annual inquiries on the structure and activities of the industrial sector, only a few of them organize industrial censuses on a regular basis and have an integrated system of industrial statistics. Moreover, the majority of African statistical services suffer from a serious shortage of specialized staff in the field of industrial statistics and, as is more than well known, inadequate material and financial resources.

## 2.2. Priority elements of the World Programme of Industrial Statistics for African countries

25. In view of the foregoing, African countries should concentrate primarily on organizing and conducting a national industrial census. This operation, which should be completed preferably in 1983 or thereabouts, should give a number of them a detailed picture of the structure of the national industrial sector and at the same time a set of complete, precise information on industrial activity. In accordance with the recommendations of the Programme, the census should be conducted in two stages, the first being a complete enumeration of major establishments i.e. those engaging at least five persons, and the other a sample of small establishments for which preference should be given to area sampling.

26. In organizing data collection on small units, national statistical services may usefully refer to the programme recommendations on family industries. In this regard it should be borne in mind that household income and expenditure surveys may also provide a considerable range of data on family industries, particularly as concerns earnings from goods or services rendered and other earnings, intermediary and direct costs, costs other than operating costs, revenue of family industrial units, fixed assets, distribution and use of labour force, source of raw materials and supplies of raw materials, type and organization of production activities, the production complex and marketing techniques. Countries in the region should pay special attention to problems relating to data collection methods, preparation of questionnaires, choice and training of enumerators, interview plans and techniques and sampling methods.

27. For most of the countries in the region, the organization of the national industrial census provided for under the Programme can also be used to build up a complete register of industrial establishments. In that regard, a preliminary enumeration should be carried out to collect data on the name and location of each establishment, the address, the name and address of the central office for establishments which are part of complex enterprises, industrial activity and size.

28. Once the industrial census has been completed countries in the region should gradually start to introduce integrated national systems of industrial statistics comprising, in addition to the censuses, annual sample surveys on the most important indicators of industrial activity and quarterly and monthly surveys for those

measures subject to seasonal or other short-term changes such as employment and output. Quarterly and monthly surveys can also be used for calculating production and industrial prices indices.

29. The establishment of national industrial statistics systems involves a series of administrative and technical steps of which the main ones are:

- (i) Creation of a central agency responsible for industrial surveys. The central agency may be a division or service of the national statistical office;
- (ii) Preparation of a central register of industrial units (the combination of directories prepared by ministries, departments and agencies);
- (iii) Harmonization of basic concepts, definitions and classification systems used;
- (iv) Standardization of the coverage of surveys with the same aims and periodicity;
- (v) Definition of a central framework for integrating all industrial statistics. The framework could be national accounts or any other system for evaluating national resources and their use;
- (vi) Lastly, the centralization of the various surveys in a data bank open to all users.

30. As well as establishing integrated national industrial statistics systems, African statistical services should endeavour to improve the quality and coverage of data. One effective and rational data processing method should also be introduced so as to reduce publication delays and make a larger range of data available to users. Recommendations have been made on these various tasks in the 1983 World Programme and they should be adapted to the circumstances in each country.

31. National programmes for the development of industrial statistics should be designed as an integral part of the efforts to develop a national statistical system as a whole and not as a series of independent actions. This approach has to be adopted because of the close links between industrial statistics and consumption and household budget statistics, population statistics, labour statistics, production and price statistics and also because of their importance in the preparation of economic accounts (in particular input-output tables), market studies, the preparation of economic models and the preparation and monitoring of development plans.

32. Moreover, by co-ordinating the development of industrial statistics with other statistical activities, countries in the region will not only improve the coherence and coverage of the data but also make considerable savings on the material, financial and manpower levels.

3. Resources required to promote the implementation of the 1983 World Programme of Industrial Statistics in the African region

33. The resources required to promote the implementation of the 1983 World Programme of Industrial Statistics in the region are of three kinds: strengthening training activities and particularly specialization in the field of industrial statistics, direct outside technical assistance and increasing the material and financial resources of national statistical services.

34. With regard to training, the Munich Centre for Advanced Training for Statisticians Economists in Developing Countries organized in 1981 two four-month courses on industrial statistics, one for English-speaking and one for French-speaking countries. Moreover, the Centre, together with UNIDO, the Statistical Office of the United Nations and ECA, is organizing a five-week regional seminar on the organization and conduct of industrial surveys for English-speaking African countries, from 11 January to 13 February 1982 in Addis Ababa. A similar seminar will probably be organized for French-speaking African countries before the end of 1982.

35. Direct external technical assistance should be of two kinds: firstly, ad hoc missions from bilateral or multilateral co-operation agencies and on the other hand the secondment of experts for an average of two to three years. Direct technical assistance should be aimed at helping national officials to carry out such diverse tasks as the establishment of an industrial census, the introduction of an integrated national industrial statistics system, improved methodology for annual surveys and the introduction of effective and rational data processing methods.

36. For its part, the Statistics Division of ECA has developed a technical assistance programme for countries of the region in the field of industrial statistics. The programme covers the period 1982-1986 and stresses the implementation of the 1983 World Programme of Industrial Statistics, the introduction of specific data collection methods for small units, the establishment of national programmes for the development of industrial statistics in the medium- and long-terms and the establishment of integrated national industrial statistics systems. As only a very limited number of advisory missions can be financed out of the regular budget of the ECA, supplementary financing for the programme is now being sought from certain multilateral co-operation agencies.

37. Countries in the region may also request technical assistance in the framework of the 1983 World Programme of Industrial Statistics from the United Nations Statistical Office and such agencies as the United States Bureau of Census, the United Kingdom Ministry for Overseas Development, the European Community and the French Co-operation Fund.

38. Lastly, activities under the programme can be financed from countries' own resources and also under agreements concluded with bilateral and multilateral co-operation agencies. It should also be recalled that financial assistance may be sought from the United Nations Development Programme on the basis of national indicative planning figures (IPF).

## CONCLUSION

39. The 1983 World Programme of Industrial Statistics is unquestionably a very useful tool for the development of industrial statistics in the region. In implementing the programme, African countries should above all focus on the organization and conduct of the industrial censuses scheduled for 1983, the gradual introduction of integrated national industrial statistics systems and the introduction of rational and effective data processing and analyses methods.

40. All countries in the region should respond favourably to the 1983 World Programme of Industrial Statistics which was launched only a few months after the adoption by the first Economic Summit of Heads of State and Government of OAU of the Lagos Plan of Action which states inter alia that industrialization is a basic option in the process of liberating the African continent from underdevelopment. The proper implementation of the Lagos Plan of Action depends on the existence of the necessary statistical support for planning and monitoring industrial development.

41. However, in view of the scarcity of national resources, the will of African countries alone is not enough to guarantee the proper implementation of the 1983 World Programme of Industrial Statistics. External assistance will be essential to support the efforts made by African countries on the technical, financial and training levels.
